PT New isolated human genes: useful for diagnosis and treatment of, PT e.g. cancers, neurological disorders, immune diseases, developmentai PT disorders or biood disorders
PS Claim II; Page 152-153; 188pp; English.
CC This sequence is encoded by a cDNA of the invention, designated Gene No. 12. This sequence represents a human secreted protein, and is CC expressed in activated neutorphils, endothedial cells, T-cells and CC to a lesser extent in brain and liver. The DNA sequences of the invention and their corresponding secreted CC polypeptides are useful for preventing, treating or ameliorating medical CC conditions, e.g. by protein or gene therapy. Also pathological conditions CC can be diagnosed by determining the amount of the new polypeptides in a CC sample or by determining the presence of mutations in the DNA sequences. Specific uses are described for each of the DNA sequences and the encoded CC proteins, based on which tissues they are most highly expressed in, and CC include developing products for the diagnosis or treatment of cancer, CC deficiencies, blood disorders, developmental abnormalities and foetal CC deficiencies, blood disorders, leukaemias, diseases of the immune system CC including allargies or asthma), hepatic disease, Alzheimer's and CC disorders and AIDS. The polypeptides are also useful for identifying CC sequence 47 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     뭥

Peptide fragment of tetracycline transporter protein.
Peptide fragment transport protein; gene therapy; screening vesicle membrane transport protein; dentification; detection;
Parkinsons disease; neurotoxin; identification; detection;
Parkinsons disease; neurotoxin; identification; detection;
                                                                                                                                                                                                                                                                                                                                                                adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other G-protein coupled receptors. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see R48759-R48758, R50569-R50807 and R89189-R89195 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptides of G-coupled receptor proteins (GPRs) - useful for binding GPR ligands or modulating GPR binding Disclosure; Page 106-107; 160pp; English.

Proteins R48685-R48758 represent a range of G-protein coupled receptor proteins selected from CAMP, adenosine, muscarinic acetyloboline, in the coupled receptor proteins selected from CAMP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           G-protein coupled bovine adrenal angiotensin II type-1 receptor protein. G-protein coupled receptor; ligand binding assay; transmembrane domain; psychotic disorder; schizophrenia; dopamine; cAMP; adenosine; thrombin; muscarinic acetylcholine; adrenergic; endothelin; bombesin; endocrine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (GPR) proteins selected from cAMP, adenosine, muscarinic acetylcholine, addrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other GPR proteins. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see W02747-W0299) for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rhodopsin; opsin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-JUN-1996 (first entry)

PS Example 2: Page 111-112; 181pp: English.

CT his sequence of the tetracycline transporter protein showed a content (CGAT) of rat. The cDNA encoding the chromaffin granule are protein (CGAT) of rat. The cDNA encoding the chromaffin granule can ine transport protein is useful in gene therapy and as a probe complete the compounds implicated in Parkinsons disease, contenting genomic sequences. The transport protein is used for screening cytotoxic compounds implicated in Parkinsons disease, considered with activity of neurotoxins or psychiatric diseases associated with activity of neurotoxins or psychiatric consorders and to identify compounds which selectively inhibit or activate its action. Antibodies raised against the transport protein are useful as immunoassay reagents for detecting the protein as affinity reagents for purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

This sequence is the mouse apoptosis inducing receptor (AIR) of the invention. AIR is a Type I transmembrane protein, soluble forms of which can be used to regulate cell death in a therapeutic setting. Soluble AIR can also be used in vitro to block apoptosis or AIR-expressing cells, or to screen agonists or antagonists of AIR activity. The cytoplasmic domain of AIR can be used to develop assays for inhibitors of AIR-induced cell death, which is useful to regulate cell death in a therapeutic setting as well as in vitro. Agonists of AIR activity can be used to kill tumour cells that express AIR, or T cells expressing AIR in autoimmune diseases. Sequence 411 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-JUL-1992; (REGC ) UNIV (Edwards RH; WPI; 94-00755)

The cDNA was amplified by anchored PCR using C-alpha and polyc primers. The amplified again using a different C-alpha specific primer. The amplified grain using a different C-alpha specific primer. The amplified product was SacII-restricted, inserted into Bluescript SK+ vector and used to transform E.cocli XI7-blue. Transformants were screened with a C-alpha specific probe and DNA from positive clones was sequenced in the C-alpha region. The sequence designated "IGR a 12" comprises the complete coding region of a gene of the subfamily v alpha 22; this subfamily was previously identified by the partial sequence (113bp) AC9 (Klein, M.H., et al., Proc.Natl.Acad.Sci. USA 84:6884, 1987). The peptide encoded by It can be used to block specific T cell epitopes or in vaccines.
New mammalian artificial chromosomes - comprising a mammalian centromere and a unique cloning site, used for stable expression product of the CII-3 gene identified in mammalian artificial chromosome MAC-8.2.3, which is contained in the human-hamster

                                                                                                                                                                                  by HIV 1 or 2.

Claim 1; Page 18-19; 24pp; English.

C This polypeptide comprises HNPDY20, a novel human 7-transmembrane

C G-protein coupled receptor that shows about 30.8% identity in 299

C amino acid residues with the thrombin receptor. Its amino acid

c sequence was deduced from an isolated HNPDY20 polynucleotide

C sequence (see V53631). The invention relates to HNPDY20

C polypeptides and recombinant materials and methods for their

C production. It also provides methods for using such polypeptides

C and HNPDY20 polynucleotides for treatment of infections such as

C bacterial, fungal, protozoan and particularly HIV-1 or HIV-2

C bacterial, fungal, protozoan and particularly HIV-1 or HIV-2

C bacterial, fungal, protozoan and particularly HIV-1 or HIV-2

C bacterial, fungal, protozoan and particularly HIV-1 or HIV-2

C bacterial, fungal, protozoan and particularly HIV-1 or HIV-2

C bacterial, fungal, protozoan and particularly HIV-1 or HIV-2

C bacterial, fungal, protozoan and particularly HIV-1 or HIV-2

C bacterial, fungal, protozoan and particularly macrosis, including asthman, Parkinson's disease, acute heart failure, hypotension,

C mycertension, urinary retention, osteoporosis, angina pectoris,

C mycertrophy, and psychotic and neurological disorders, including

C anxiety, schizophrenia, manic depression, delirium, dementia,

Severe mental retardation and dyskinesias, such as Huntingdon's

severe mental retardation and dyskinesias, such as Huntingdon's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

A portion of the CII-3 gene (see also T72461-65) or of CII-3 CDNA (T72466) can be utilised as a unique cloning site and selectable marker in an MAC, allowing the site-specific integration of an exogenous nucleic acid sequence into the MAC. The MAC can be used for stable expression of large fragments of DNA and also for the production of transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (SMIK ) SMITHKLINE BEECHAM CORP.
Bergsma DJ, Fuetterer WS, Mao JY, Sathe WPI; 98-482962/42.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human 7-transmembrane receptor HNFDY20.

HNFDY20; G-protein coupled receptor; human; infection; HIV; pain; cancer; anorexia: asthma: Parkinson's disease; acute heart fallure; hypotension; hypertension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcer; allergy; benign perstatic hypertrophy; psychosis; anxiety; schizophrenia; manic depression; delirium; dementia; mental retardation; dyskinesia; Huntingdon's disease; Gilles de la Tourette's syndrome; dyskinesia; Huntingdon's disease; Gilles de la Tourette's syndrome;
                  disease or Gilles de la Touretté's syndrome. Gene therapy using RNA encoding HNYDY20 can be used to treat conditions caused by under-expression of the protein. The invention also relates to methods of identifying agonists and antagonists and for using such compounds to treat conditions associated with HNYDY20 imbalance. Diagnostic assays for detecting diseases associated with inappropriate HNYDY20 activity or levels are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides and polypeptides encoding a novel human 7-transmembrane receptor - useful for diagnosing and treating e.g. cancer, osteoporosis and Parkinson's disease and infections caused

PT msin nucleic acids encoding recombinant polypeptide(s) that
PT associate with Mad polypeptide - are possible homologues of S.
PT cerevisiae general repressor protein Sin Sin Sequence 12; Fig 23A-C; 1llpp; English.

PT cerevisiae general repressor protein Sin Sin Sequence represents the murine protein, designated msinA, which may complex english.

CT his sequence represents the murine protein, designated msinA, which may complex english associates with a Mad complex which preferably associates complex which preferably associates are polypeptide to form a msin:Mad.Max complex which binds to a completide sequence comprising CACGTG. Mad is a basic helix-loop-helix complex super protein which can compete with Myc by forming sequence complexes activate, transcription from promoters containing colored protein complexes with Max. Mad:Max complexes repress, while Myc.Max complexes activate, transcription from promoters containing colored protein captured to differentation in at least two distinct cell lineages. The switch from Myc.Max to Mad:Max complexes may reflect the repression contains useful in elucidation of Mad repressor functions.

Mad is a basic helix-loop-helix (BHLH) zipper protein which can compete with Myc by forming sequence-specific DNA-binding heterocomplexes with Max. Mad:Max complexes repress, while Myc:Max complexes activate, transcription from promoters containing proximal CACGTG binding sites for these proteins. Expression of Mad is closely linked to differentation in at least two distinct cell lineages. The switch from Myc:Max to Mad:Max complexes may reflect the repression of transcription of Myc regulated genes by Mad. The DNA, vectors and host cells of the invention are useful for the recombinant production of mSin proteins useful in elucidation of Mad repressor functions.

PT Nucleic acid encoding 5HT-1D receptors and their antibodies - provided to treat and diagnose conditions caused by abnormal 5HT-1D receptor expression e.g. dementia proceptor encoded by gene 8-30-84 cc and gene 11, respectively. A full-length clone corresponding to and gene 11, respectively. A full-length clone corresponding to gene 11 was isolated from a human placental library. The cc amino acid sequence deduced from the nucleotide sequence predicts a mol.wt. 44,333 protein. Comparison of this protein sequence with previously characterised neurotransmitter receptors suggests that it is a new_member_of, the G protein-coupled receptor family.

                                                                                                                                                                                                                                              Cyclo:malto:dextrin glucano:transferase coding DNA sequence -
including corresp, plasmid and microbe transformed by plasmid
Disclosure; Page 831; 16pp; Japanese.
DNA, the plasmid contg, it, and any microorganism transformed with the
plasmid are new. Transformed strains show CGTase activity after 16 hrs
culture on LB plate. 38-2 CGTase and 17-1 CGTase genes are each stably
retained in E.coli cells translated to CGTase efficiently. Large amts.
polypeptide with CGTase activity can be obtd.
Sequence 713 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 coding amino acid sequence.

Disclosure; Fig 6; 16pp; Japanese.

The sequence is deduced from a DNA from pUCP1. The sequence is divided into four units (U1-U4) by restriction sites in the DNA. By combining these with similar units (S1-S4) from CGTase 38-2 (R10051), e.g.S1-U2-U3-S4 or U1-S2-U3-S4. enzymes with properties of both strains can be produced. The hybrids compensate for defects in the individual enzymes and can be designed to display optimum characteristics of pH and temperature stability. See also R10052.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      28-APR-1989; JP-110603

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm Fri Oct 22 18:45:15 1999; MasPar time 2.38 Seconds 383.184 Million cell updates/sec

Tabular output not generated.

Scoring table: Description: Perfect Score: PAM 150 Gap 11 >US-09-092-296-15 (1-78) from US09092296.pep 558 1 MGSGLPLVLLLTLLGSSHGT.....SGTSVTLHHARSQHHVVCNT 78

Searched: 119857 seqs, 11713122 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-issued 1:5A_COMB 2:5B_COMB 3:PCT9_COMB 4:backfiles1

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 25.509; Variance 122.762; scale 0.208

pir60 1:pir1 2:pir2 3:pir3 4:pir4

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 39.113; Variance 85.189; scale 0.459

- I SUBCELLULAR LOCATION: NUCLEAR (PROBABLE).

- TISSUE SPECIFICITY: LARGELY RESTRICTED TO THE CNS OF LATE EMBRYO-

- SIMILARITY: CONTAINS THREE HOMEOBOX DOMAINS.

J. BIOL. CHEM. 265:15525-15530(1990).

FUNCTION: RESISTANCE TO TETRACYCLINE BY AN ACTIVE TETRACYCLINE EFFLUX. THIS IS AN ENERGY-DEPENDENT PROCESS THAT DECREASES THE ACCUMULATION OF THE ANVIBLOTIC IN WHOLE CELLS. THIS PROTEIN FUNCTIONS AS A METAL-TETRACYCLINE/H-ANVIBORTER.

SUBCELULLAR LOCATION: INTEGRAL MEMBRANE PROTEIN. INNER MEMBRANE.

SUBCELULLAR LOCATION: THE MAJOR FACILITATOR FAMILY (ALSO KNOWN AS THE DRUG RESISTANCE TRANSLOCASE FAMILY).

MICROBIOL. 17:961-969(1995).

-!- FUNCTION: REQUIRED FOR ROTATION OF THE FLAGELLAR MOTOR. PROBABLE TRANSMEMBRANE PROTON CHANNEL (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. INNER MEMBRANE.

-!- SIMILARITY: BELONGS TO THE MOTA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "Analysis of the motA flagellar motor gene from Rhodobacter sphaeroides, a bacterium with a unidirectional, stop-start flagellum.";

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
